

*Did you know:*

*Agricultural Granules were first used to control mosquito larvae in swampy areas!*

Following expansion of capacity in 2015, Exwold continue to specialise in the contract manufacture of Granular Insecticides using Impregnation & Coating Technology.

Exwold facts :

- Contract manufacture of Nematicides , Acaracides & Insecticides for Direct Application
- Coating is a method of producing a granule by applying a coating of liquid (usually the active ingredient) to a solid material.
- Impregnation is similar to the coating process, the difference is that the liquid is absorbed into the granule.
- Exwold have 2 Drum Blenders for the manufacture of granular insecticides.
- With direct application products, dustiness is an important consideration and Drum Blenders have a gentle action so reducing attrition of the granules during blending.
- Exwold have an annual capacity > 10,000mt.
- Fully contained charging booths to ensure the safe handling of hazardous active ingredients.
- Auxiliary liquid handling capacity including pre-mix blending.
- In situ Packing line available for packing into bags.

You can read more about Exwold's other granulation technologies including our Extrusion technology at [www.exwold.com](http://www.exwold.com).

Exwold are proud to be a company based on Science, Technology, Innovation & Partnership.
